

# SÉMINAIRE DU DÉPARTEMENT DE GÉNIE PHYSIQUE

Jeudi 13 septembre 2018 – 11h00

Pavillon principal, salle A-401

**Stefan Heun**

NEST, Istituto Nanoscienze-CNR and Scuola Normale Superiore, Pisa, Italy

## Optimization of few-layer black phosphorus for low-temperature magneto-transport studies

I will review our activities on black phosphorus (bP). We obtain high-quality few-layer bP flakes via mechanical exfoliation in nitrogen atmosphere, liquid phase exfoliation [1], and direct exfoliation in a polymer matrix which also protects the bP flakes at the same time [2].

The bP flakes are structurally characterized by AFM, Raman, and STM. I will present a study of surface modification on exfoliated bP flakes upon subsequent annealing steps, up to 550°C, well above the sublimation temperature. In particular, our attention is focused on the temperature range around 375°C - 400°C, when sublimation starts, and a controlled desorption from the surface occurs with the formation of characteristic well-aligned craters. With atomically-resolved STM images we show that the long axis of the craters is aligned along the [100] (zig-zag) direction of bP [3].

Flakes were also processed into Hall-bar devices. Low-temperature magneto-transport has shown clear evidence for weak localization in these flakes, with a strong in-plane anisotropy due to the crystalline anisotropy of bP [4]. A similar anisotropy was observed for high-field in-plane magnetic fields [5]. Furthermore, the PMMA/bP nanocomposite described above was used to directly fabricate bP devices from it, using the PMMA as an electron beam resist [6].

*The author thanks the European Research Council (ERC) under the European Union's Horizon 2020 research and innovation program (Grant Agreement No. 670173) for funding the project PHOSFUN "Phosphorene functionalization: a new platform for advanced multifunctional materials" through an ERC Advanced Grant.*
